

1. PROJECT OVERVIEW

- **Project Title:** FitBuddy - AI Workout Generator
- **Team Leader:** I.Manikandaprabu

2. PRESENTATION STRATEGY:

To effectively showcase the end-to-end capabilities of the FitBuddy platform within a limited demonstration window, a sequential roadmap has been formulated.

3. SEQUENTIAL DEMO ROADMAP

- **Step 1: Environment Initialization:** The presentation will begin by booting the Uvicorn ASGI server (`uvicorn app.main:app --reload`), proving the FastAPI backend is operational on the local host.
- **Step 2: Profile Submission:** The presenter will navigate to the web UI and input a test user profile (e.g., 25 years old, 75kg, Muscle Gain, High Intensity) to demonstrate the frontend data collection.
- **Step 3: Background Orchestration & AI Processing:** The presenter will submit the form, allowing the audience to observe the rapid response time facilitated by the `gemini-3.5-flash-lite` model. The presenter will also verbally outline the 10-second timeout fail-safe operating in the background.
- **Step 4: Result Verification:** The dynamically rendered Jinja2 result page will be evaluated to verify that the AI-generated exercises match the requested "Muscle Gain" and "High Intensity" parameters.
- **Step 5: Database Validation:** Finally, the presenter will navigate to the Admin Dashboard to visually prove that the SQLite database successfully captured and stored the new user session.
